JUSTIN SCHOMER

Vulnerability Engineering & Automated Security Compliance Specialist
- Email: schomerjustin1987@gmail.com
- Phone: +1 217-955-4382
- Location: Decatur, Illinois, United States
- Availability: Immediate (Remote Solo Operator / Freelance)

PROFESSIONAL PROFILE & EXECUTIVE SUMMARY

High-agency application security engineer and solo backend developer with 5+ years of intensive technical execution in low-layer vulnerability research, deterministic risk prioritization, and automated governance workflows. Specializing in eliminating manual GRC overhead by deploying memory-safe automation logic that transforms chaotic vulnerability data streams into structured, auditable assets. Fully independent operator who engineers solutions entirely from scratch within clean terminal and Linux runtime environments.

CORE TECHNICAL SPECIALIZATIONS

- Vulnerability Management: Advanced CVSS/CWE risk triaging, automated asset profiling, validation loops.
- Remediation & Patching: Lifecycle automation (n8n, Python streams, Bash), system state tracking (Dev/Staging/Prod).
- Security Compliance & GRC: Mapping telemetry directly to NIST SP 800-53 (Rev. 5), SOC 2 Type II, and CIS Benchmarks.
- Network & AppSec Hardening: Layer Zero gate logic, runtime boundary verification, temporary IPS isolation profiles.
- Data Pipelines & CTI: Ingesting and converting multi-vendor scanner data into standardized STIX 2.1 threat objects.

INVENTIONS & TECHNICAL PROJECTS

Founder & Lead Architect | Layer-Zero Trust Boundary Framework

- Engineered a deterministic, low-overhead filtering engine running inside isolated terminal runtimes to parse massive transactional system logs.
- Programmatically converted raw, multi-vendor vulnerability telemetry into structured, machine-readable STIX 2.1-compliant threat graphing objects for enterprise visual presentation.
- Designed and executed a strict prioritization matrix based on (Environment + Accessibility + Criticality) to automatically isolate high-risk zero-click exploit vectors while filtering out automated scanner noise.
- Successfully validated framework resilience against intensive automated stress tests, recording zero trust boundary violations.

Automation Systems Architect | Freelance & Independent Research (2021 - Present)

- Built custom, lightweight Python streaming pipelines and self-hosted automation infrastructure to coordinate security updates across multi-team technical environments.
- Integrated automated vulnerability tracking triggers that orchestrate staging-to-production patch testing campaigns while maintaining zero third-party software dependencies.
- Enforced tactical network-level isolation controls using runtime detection rules to freeze active exploit vectors during critical patch deployment windows, preserving infrastructure stability and uptime.
- Formulated comprehensive GRC executive dashboard layouts to map raw system indicators to auditable compliance documentation.

EDUCATION & LEARNING JOURNEY

- Self-Taught Security Engineering Lifecycle: Built full technical competency from the ground up starting in 2021 via intensive independent documentation study, advanced TryHackMe rooms, and live environment architecture building.
- Focused entirely on high-execution, non-traditional engineering skills, prioritizing iterative learning and direct code execution over rigid corporate certification frameworks.
